TABLE OF CONTENTS

PART I - THEORY	8
CHAPTER I. Conceptual Clarifications	8
I.1.1. Definition of nursing based on the six defining characteristics	8
I.1.2. Some reflections on the issues that arise in the definition of nursing	11
I.1.2.1. The paradox in nursing	11
I.1.2.2. Differentiation of professional nursing from the nursing practiced by other individuals	11
I.1.2.3. Differentiation the nursing discipline from other healthcare disciplines	11
I.1.3. Examples of definitions of nursing used in healthcare network	16
I.1.3.1. Classic definitions	16
I.1.3.2. Modern definitions	17
CHAPTER II. Main milestones in the reform of Romanian medical education system for nurses	21
II.1. Initial training of nurses before 1990	21
II.2. Changes in nurse training after 1990	22
II.3. Nowadays forms of educational training of nurses	24
CHAPTER III. Methodological and legislative guidelines in the university training for nursing activities	26
III.1 The role of the nursing trainer	26
III.1.1 The role of a teacher	27
III.1.2 The role of a researcher	29
III.1.3. The role of a collaborator	30
III.2. Proficiency of nursing teaching staff	31
CHAPTER IV. Teaching and learning methods in nursing	35
IV.1. Case study: an alternative method of teaching and learning of nursing	35
IV.1.1. The importance of using the case study	35
IV.1.2. Learning using case studies	36

IV.1.2.1. Guide for the use of case studies in the class	37
IV.1.3. Students' perception on the experience of the case study in seminars or classes	38
IV.1.4. Using case studies in the nursing (care) of patients	39
IV.1.4.1. Characteristics of the nursing process	39
IV.1.4.2. Exploring the educational experience using the case study to the students at healthcare	40
IV.1.5. Forms of case studies and their description	41
IV.1.5.1. The impact of standardized case studies on students' performance	41
IV.1.5.2. A particular aspect of standardized case studies	42
IV.1.6. The case study in chronic and acute diseases	43
IV.1.6.1. Model - Case Study in chronic diseases	44
IV.1.6.2. Model of case study in acute diseases	46
IV.2. The role of mnemonics in nursing	48
IV.2.1. The beginnings of mnemonic words	49
IV.2.2. History of mnemonics in nursing and medicine - a review of literature	49
IV.2.3. Review of studies in education based on mnemonic words	50
IV.2.4. Mnemonic types and strategies	52
IV.2.4. 1. Mnemonic types (devices, signs) used in nursing or in medicine	52
IV.2.4. 2. Mnemonic methods used in nursing and in medicine	53
IV.2.5. Design and implementation suggestions of the mnemonic formulas in drawing up nursing (care) plans	56
IV.2.5.1. Use of mnemonics within the organization chart of a nursing plan	56
IV.2.5.2. Examples of alphabetical mnemonic words for students who draw up nursing plans	57
IV.2.6. Description of the learning experience from teaching perspective	60
IV.2.6.1. The role or the implications of error-free learning in learning experience	60
IV.2.7. The association of a mnemonic study program with a constructivist one	62
IV.3. Multimedia learning – a learning strategy of the "Y Generation"	65

IV.3.1. On the Y Generation and psychopedagogy valences of multimedia learning	65
IV.3.2. YouTube - one of the most important social media sites	66
IV.3.3. Ways to integrate technology into nursing education	67
IV.3.3.1. Engaging students in analysing YouTube videos	67
IV.3.3.2. The Edutainment theory	69
IV.3.4. Advantages of using multimedia	70
IV.3.4.1. Using artistic movies	71
IV.3.5. Discussion on teachers and students' perception in the use of multimedia	72
IV.4. Learning nursing in a practical or clinical environment	74
IV.4.1. Learning Environment (LE)	74
IV.4.2. The content of the learning environment	74
IV.4.3. Construction and improvement of the learning environment	76
CHAPTER V. Targeted skills for initial training of nurses	78
V.1. Definitions of skills after QSEN	78
V.2. General skills for nurses (Cons. Nursing Hong 2012)	78
V.3. General skills for nurses (Creativity and connections, Nurse of the future, Massachusetts 2010)	85
V.4. Profile of targeted skills for initial training of nurses having completed secondary education And of licensed medical graduates	91
V.5. Acquiring new skills set out in 2005/36/EC Directive	92
V.6. Skills extracted from documents	93
V.6.1. Skills extracted from internal documents	93
V.6.1.1. Diploma supplement for the specialization of general nursing	93
V.6.1.2. Skills extracted from internal documents; Law no. 278/2015	94
V.6.2. Skills extracted from external documents	95
V.6.2.1. Other specializations (BBU)	95
V.6.2.2. Skills required on foreign printed forms for a general nurse	95
V.6.2.3. Skills required on printed forms abroad	95

CHAPTER VI. The importance of assertiveness training and development in the context of training and educational activities aiming nursing	96
VI.1. Terminological delimitations	96
VI.2. Relevance to the investigated field	97
VI.3. Presentation of relevant literature	98
PART II - PRACTICE	101
VII. Research Methodology	104
VII.1. Study no. 1	104
VII.2. Content models of nursing courses	113
VII.3. Comparative, qualitative and quantitative analyses for study 1	126
VII.4. Study no. 2	145
VII.4.1. Study no.2.A	145
VII.4.2. Study no.2.B	157
VII.4.2.1. Conducting workshops	160
VII.5. Comparative, qualitative and quantitative analyses for study 2	171
VIII. RESULTS AND DISCUSSION	192
VIII.1. The 1.A study results	192
VIII.2. The 1.B study results	193
VIII.3. The 2.A study results	201
VIII.4. The 2.B study results	204
GENERAL CONCLUSIONS	207

KEY TERMS

Nursing, healthcare oriented, practice, interpersonal, problem solving, systematic, standardized case study, mnemonic words, acronym, multimedia learning, multimedia techniques, nursing plan, holistic, holistic, therapeutic, patient-centred, skill, assertiveness, performance, intermediary test, final test, clinical reasoning, the individual as a whole.

THESIS STRUCTURE AND SUMMARY

The thesis entitled "*Optimization program of initial academic education for nursing activities. Applications at UMF Cluj-Napoca*" is divided into two major parts, namely *the theoretical part and the practical part*.

In Chapter I (**Conceptual clarifications**) we wanted to highlight some of the general aspects of nursing, a brief history of the definition of nursing based on six defining characteristics, a list of definitions of nursing in classical and modern perspective.

The theoretical approach continues in chapter II (**Main milestones in the reform of Romanian medical education system for nurses**) with the presentation of initial training of the nurse before 1990 and of changes in nurse training after 1990 and up to date.

In Chapter III (**Methodological and legislative guidelines in the university training for nursing activities**), the nursing trainer currently cumulates three complementary roles: teacher, researcher and collaborator. The roles are assumed based on knowledge and skills developed according to a training model that blends ideology of vocational nursing translated into curriculum for bachelor studies.

In Chapter IV (**Teaching and learning methods in nursing**) we showed theoretical aspects regarding teaching methods used in teaching activities. The initiated research by the methods of the case study, mnemotechnics and multimedia learning, is theoretically based on active methods of teaching and learning, on exemplification and analysing teaching and learning situations built through a personal educational program based on the use of the three methods and techniques. From the perspective of analysing learning situations where the personally conceived nursing educational program is applied, this involves specific features of active-participatory teaching methods.

In Chapter V (**Targeted skills for initial training of nurses**) there are given certain skills from the perspective of some Nursing Councils. Of cognitive abilities, there are outlined critical thinking, decision making, problem solving, planning, reflective thinking, assertiveness, communication - interviewing skills, counselling and professionalism. In this chapter there are also presented skills targeted for initial training of nurses with secondary education and for higher education graduates, all taken from the Classification of occupations in Romania (COR), skills extracted from internal documents (diploma supplement for the specialization of general nursing and other internal documents) and external documents (foreign printed forms for nurses). The theoretical approach of this chapter is continued by defining the favourable contexts for training and exercising these skills.

Chapter VI (**The importance of assertiveness training and development in the context of training and educational activities aiming nursing**) describes the importance of assertiveness in the field of nursing, stressing that today's students are the core of tomorrow's nurses and it is essential to highlight the factors that can influence students to behave assertively, knowing that a traditional learning environment does not develop skills nor prepares students to become autonomous and assertive.

Part II of the thesis entitled "**Experimental approach. Presenting the research on personally conceived educational program in the field of nursing**" begins with Chapter VII, the pilot study, ascertaining study, that aimed at highlighting students' views on training through the three methods and techniques and making a radiograph of available resources during implementation of this research in order to identify possible solutions to increase learning outcomes in the field of nursing. The experiment was applied after the pilot experiment, with the same coordinates, subordinates of a teaching research with some differences: reconsidering the structure of the course to be taught by introducing the case study, mnemonics and multimedia methods and techniques. The group consisted of students of the second year. Sampling was conducted on a voluntary basis, also in semester 1 the control group was made of 24 students and the experimental group was made of 20 students. In the semester 2, both the control group and the experimental group were made of the same number of subjects. The control group were taught the same training topics as the experimental group through lecture or reading.

Subchapter VII.2. presents a model for the content of nursing courses made of: representative artistic movies, specific representative acronym video films and images with

explanations, standardized or not standardized case study, articles, scientific studies from relevant journals, multiple choice questions with five possible answers and tables of contents of each course.

GENERAL CONCLUSIONS

Following the results achieved in the context of qualitative and quantitative analysis, we can formulate some conclusions:

- Summarizing the significant differences between results obtained before starting the experiential group program focused on the use in teaching activity of case study, mnemonics and multimedia learning methods and after its completion, but also between the experimental group and the control group, they are translated into the following major changes:
 - the personally conceived educational program in the field of nursing by applying an optimally structured, logically articulated, medical, pedagogical and didactic learning program determined for the student a new learning student-centred experience, centred on students' transformation from object into subject of education;
 - implementing educational programs conceived by teachers is a way of teaching-learning-assessment superior to the traditional learning;
 - the implementation of the educational program is an approach, sometimes difficult, that with all impediments: long time allotted by the teacher, difficulties due to preparation in implementing a new educational program, is a sure way to improve students' academic results in the field of nursing;
 - the developed the program encourages students to have an open attitude towards learning, it stimulates interest acting as a facilitator in understanding, not by explanations;
 - the memorizing activities of the part where there is involved the mnemonic method surprise by rapidity and efficiency and inserted multimedia supports the understanding of the content and the case study develops landmarks in rendering the nursing plan.
