## CONTENTS

<b>LIST OF TABLES .....</b>	<b>4</b>
<b>LIST OF FIGURES .....</b>	<b>5</b>
<b>LIST OF ANNEXURE.....</b>	<b>8</b>
<b>INTRODUCTION.....</b>	<b>9</b>
<b>CHAPTER 1: FINANCIAL SECTOR AND LOW CARBON ECONOMY: AN ANALYSIS .....</b>	<b>17</b>
1.2 Importance of Financial Sector for low carbon economy .....	17
1.3 Nature of Financial System .....	19
1.4 Significance of Global Finance .....	20
1.5 Need for Green Financial system.....	20
1.6 Strategies of Long term and short term Investments .....	21
1.7 Importance of Low Carbon in Climate Change.....	22
1.8 Definition and Growth of Low Carbon Development .....	22
1.9 Emergence of Low Carbon Economy .....	23
1.10 Principles and Policies of the Paris Agreement .....	24
1.11 Kinds of Economic Theories of Growth .....	24
<i>1.11.1 Definition and Hypothesis of Endogenous Growth Theory .....</i>	<i>25</i>
<i>1.11.2 Nature and Hypothesis of Romer Growth Model.....</i>	<i>25</i>
1.12 Empirical Research on Financial Sector in Low Carbon Economy .....	25
1.13 Conclusions on the Empirical Analysis of Financial Sector in Low Carbon Economy.....	60
<i>1.13.1 Achievements of world nations .....</i>	<i>61</i>
<i>1.13.2 Investment Bias .....</i>	<i>61</i>
1.14 Recommendations and Policy Implications .....	67
<b>CHAPTER 2: AN EMPIRICAL STUDY ON CARBON TAX .....</b>	<b>69</b>
2. 1 Introduction on carbon tax .....	69
2.2 Carbon Pricing Policies.....	70

2.2.1	<i>The Paris Agreement</i> .....	71
2.2.2	<i>Rulebook to the Paris Agreement</i> .....	76
2.3	Growth of Carbon Pricing Mechanism .....	77
2.3.1	<i>Principles of Carbon Tax</i> .....	78
2.3.2	<i>Growth and principles of Emission Trading System (ETS)</i> .....	79
2.3.3	<i>Definition of Crediting Mechanism</i> .....	79
2.3.4	<i>Guiding Principles of Result-based Climate Finance (RBCF)</i> .....	80
2.3.5	<i>Kinds of Internal Carbon Pricing</i> .....	80
i.	<i>Shadow Price; and</i> .....	80
ii.	<i>Internal Carbon Fee.</i> .....	80
2.4	Carbon Pricing Initiatives.....	81
2.5	Empirical Analysis of Carbon Tax .....	84
2.5.1	<i>Nations for Practicing Carbon Tax in Model 1</i> .....	85
2.5.2	<i>Nations for Carbon Revenue and Carbon MT in Model 2</i> .....	86
2.5.3	<i>Nations for Emission Trading System in Model 3</i> .....	86
2.6	Number of Nations Practicing Carbon Tax in Model 1 .....	87
2.6.1	<i>Data Analysis of Carbon Tax in Model 1</i> .....	87
2.6.2	<i>Correlation relationship among variables</i> .....	88
2.7	Carbon Revenue and Carbon MT in Model 2 .....	99
2.7.1	<i>Data Analysis of Carbon Revenue and Carbon MT</i> .....	99
2.7.2	<i>Correlation relationships among variables in Model 2</i> .....	100
2.8	Emission Trading System in Model 3.....	107
2.8.1	<i>Data Analysis of Emission Trading System</i> .....	107
2.8.2	<i>Correlation relationship among the variables</i> .....	108
2.9	Comparative analysis between Model 1, Model 2, and Model 3.....	114
2.9.1	Value analysis of Model 2 and Model 3.....	114
2.9.2	Sustainable economic growth, Grant Revenue, Carbon Price, CO <sub>2</sub> , GHG, and Reduction Emission.....	116
2.10	Review of Carbon Tax .....	116
2.11	Conclusion of Carbon Tax on Green Growth.....	120
2.12	Recommendations on the implementation of Carbon Tax .....	123
<b>CHAPTER 3: NEW GLOBAL FINANCIAL SYSTEM FOR GREEN ECONOMY .....</b>		<b>126</b>

3.1 Introduction of new global financial system .....	126
3.2 Need for New Financial System .....	127
3.3 COVID Pandemic and Climate Change.....	127
3.3.1 <i>Estimated drop in aggregate working hours</i> .....	128
3.3.2 <i>Employment in countries with workplace closures</i> .....	129
3.3.3 <i>Industrial Production Index of world</i> .....	129
3.3.4 <i>Global Industrial Production</i> .....	130
3.3.5 <i>COVID-19 Cases of top nations</i> .....	131
3.4 Challenges of Green Economy and Development .....	133
3.5 Dimensions of New Global Financial System.....	134
3.5.1 <i>Depth of Financial institutions</i> .....	136
3.5.2 <i>Access-Financial Markets</i> .....	137
3.5.3 <i>Efficiency of Financial Markets</i> .....	138
3.5.4 <i>Key Aspects of Long Term Finance – Selected Countries</i> .....	139
3.6 Empirical Analysis of New Financial System for Green Economy and Development.....	141
3.7 Econometrical Analysis of Variables of New Financial System .....	142
3.7.1 <i>Data Analysis of Variables</i> .....	142
3.7.2 <i>Correlation Matrix of Variables</i> .....	143
3.7.3 <i>Analysis of Variables of new financial System</i> .....	145
3.7.4 <i>Comparative Analysis of Variables of New Financial System</i> .....	162
3.7.5 <i>Income and Air Pollution</i> .....	179
3.8 Conclusions on Empirical analysis of New Financial System for Green Economy .....	181
3.9 Recommendations for New Financial System.....	182
<b>CONCLUSIONS OF PHD THESIS .....</b>	<b>184</b>
<b>BIBLIOGRAPHY .....</b>	<b>187</b>
<b>ANNEXURE.....</b>	<b>195</b>

# INTRODUCTION

## Motivation, Contributions, Structure and Limitations of the PhD Thesis

Ben S. Bernanke, Banker, and financial Specialist, USA held that there would be troublesome for a supported financial recuperation amid the monetary emergency. The weak financial system is not the answer to the crisis, unlike the strong financial system. European Union has taken suitable measures to strengthen it. The central bank allocates resources towards a sustainable and green economy for the same it has to reorient its conventional goals and responsibilities. Climate alter makes a difference the budgetary framework for a accomplishing the change to a green economy. According to the IPCC report every year \$ 2.5 to\$3.5 trillion until 2035. The central banks need to restructure their priorities towards a green economy without compromising financial stability. For achieving a green economy, it has to involve the financial sector and other institutions for strong investment decisions. The COVID-19 pandemic poses a huge challenge because it comes about into the negative development rate of GDP and moderate recuperation. The efficient financial sector, expanding the finance through carbon pricing for green investment and evolving new global financial system, make the financial system stronger and dynamic.

### *Motivation for choosing the topic and relevance of research*

Global warming has caused climate changes which result in challenges to humanity and nature. It is important to find solutions to these problems. One of them is to develop an appropriate global financial system for green growth as one of the permanent solutions. Long-term investment in the green economy is found normally difficult since their returns are very slow and late. Thus, it becomes essential to find out a solution through the new global financial system for green growth. This is the primary motivation. Another motivation has resulted from earlier research and publications. The most important of them are given below:

1. **R. Malar Maran** and Alexandru-Mircea NEDELEA (Maran 2017a). Corporate Finance Theories and Principles: Redundant, *ECO FORUM*, Volume 6, Issue 2 (11), 2017

### ***Contributions***

The contributions of this study to the literature are several. *It is one of the most important contributions of this study to find a solution on the reduction of global warming to 1.5 C as projected in the Paris Agreement, 2015.* Countries got to cut outflows significantly underneath 1.5<sup>o</sup> C for carbon nonpartisanship by 2050 (Antonio Guterres, 2020). *The second contribution is to achieve stability of reduction of global warming through degrowth.* It recommends degrowth from presently onwards without delaying to 2040 (Simon Kuper, 2019). *The third contribution is to gain confidence of green growth and development in practice.* The hypothesis of green development needs experimental proof. *The fourth contribution of this study is to strengthen the OECD Environment Strategy of decoupling of ill effects of environment in the economic*

*development through green growth.* The ponder recommends a changeless decoupling of common assets and carbon outflows from GDP (Hickel and Kallis, 2019). A few things about suggesting degrowth (Victor, 2008; Alier, 2009; Jackson, 2009; Kallis et al., 2012) and others recommend moving from carbon-intensive to moo or carbon divisions (Gough, 2017; Kallis, 2018). *The fifth contribution is to establish a sound link between environment and development.* The link between environment and development is achievable through empowerment of sustainable development (Rathnaswamy, 1998, 2000; Guerres, 2017). *The sixth contribution of this study identifies to augment the long term investment towards green growth.* Long term finance is the source of sustainable development and it must flow from home, firm and nation. To generate the sources of long term firms, there are three themes (BCSD, 2017). The development structure of fund advances economical money related improvement in regard of long term back for quicker development within the brief term of vulnerabilities of advertise conditions (de la Torre, Ize, and Schmukler, 2012; Demirguc-Kunt and Maksimovic, 1998, 1999). The worldwide money related emergency caused declining economical financial development and bank credit, inflation, and non-performing credits (Batrancea Ioan et al., 2020). Precise contamination arrangements decrease emanations that cause low harms and costs (Hamilton, 2003). *The seventh contribution is the establishment of new global financial system for green growth.* There is a new order of global financial system to make green economy and reduction of CO<sub>2</sub> emissions and global warming and it is within the reach of world nations to carry out the Paris Agreement.

### ***Structure of the PhD thesis***

The PhD thesis “New Global Financial System - Green Growth: A Review” is containing three chapters, including theoretical and practical approaches, examined the developed economies, the transition economies and emerging economies through econometric modelling.

***The first chapter*** aims to find the Cointegrating relationship between financial sector investment and low carbon economy. The low carbon economy achieves a reduction in CO<sub>2</sub>, N<sub>2</sub>O, and GHG and it will lead to sustainable development as there is economic growth (GDP). Long term investments are those investments that last for more than one year while short term investment is for the period of one year or less than one year. Both these investments have merits and demerits. One of them is the flexible benefits that accrue to them. Inflation and fluctuation markets are other factors that influence them. Return on resources is pivotal in choosing the ventures. The Bretton

Woods framework got to be unimportant amid the worldwide monetary emergency and started unused worldwide fund. There was an around the world emergency amid the worldwide monetary emergency driving to the obligation emergency within the Euro zone. The quick activity of globalization needs redress for reestablishing maintained development social advance, and financial and monetary steadiness as there's overcompensation of the budgetary division. The financial system is not contributing to economic development. The financial sector contributes to economic growth. European Union identifies the finance and investment challenges. There are several proposals in this regard. One of them is the moo carbon economy for a long-term maintainable advancement whereas coordination moderation and adjustment. It intends to mobilise additional finance and investment for achieving 2 degrees Celsius and for the same, there is a need for improvement in technology innovation and capacity building.

*The second chapter* discusses that carbon pricing reduces CO<sub>2</sub> emissions and global warming. It promotes green investment and it is compensation to the environmental damages. In reaction to Paris arrangements on climate alter, the world countries incline toward the carbon estimating for lessening greenhouse gas to lower climate dangers. Carbon estimating has sound financial standards and involvement. Carbon estimating depends on the 'polluter pays principle' to compensate for the harm caused and returns for reestablishing the environment. The polluter pays in two different instruments which are carbon price and quota-based system of emissions trading system. It incorporates the principle of fairness and fair practice. Carbon pricing policies are effective with other non-climate policies to a low-carbon economy. It indicates credibility and stability for long-term investment decisions by adjusting the carbon tax or rule-based emissions trading system (ETS). Carbon estimating advances of a low-carbon economy. It hones straightforwardness in price-fixing.

*The third chapter* discusses the emerging new global financial system for the green economy as the global financial system finds difficulties in promoting it. The financial system represents institutions, markets, intermediaries, and instruments to promote investment and savings while promoting economic growth development. An effective financial system establishes an effective network of financial institutions, financial markets, financial instruments, and financial services for promoting financial integration within the economy for effective production, distribution, and development. The financial system offers opportunities to transfer risks on

investment and in this process; the borrowers generate funds in the financial system. The global financial system must promote sustained economic growth and social development for which three core pillars of the future of the global financial system and these pillars need to give to economic growth and financial stability. Pillar I promotes efficient capital allocation and ensuring financial stability; Pillar II recommends worldwide budgetary incorporation; and Pillar III offers development in decreasing the obstructions to monetary administration. The over the top risk-taking by the money related teach without considering the impact, caused the worldwide monetary emergency. Taking into thought of worldwide warming and other issues of climate alter there's a require for green development, and it proposes a new modern range of global financial framework to create a green economy.

### ***Current knowledge status within the research field***

Through its three chapters, the Ph.D. thesis analyses theoretical aspects, concepts, indicators, models of analysis, and financial diagnostic values by extensive documentation through books, articles from reputed journals, reports and working papers of international financial institutions, web pages of financial entities. The results and conclusions of global financial systems of developed economies, transition economies, and emerging markets, and international researchers are in a comprehensive explanation on the theoretical and practical research with an emphasis on the weaknesses and strengths.

Defining the financial system and financial sectors rely on the authors such as Allen and Gale (1995, 1197, 2000), Antzoulates et al (2011), Franklin Allen and Douglas Gale, 1999, Levine, 2005).

The subsystems of the new order of the global financial system and the green economy refer to the following studies:

### ***Chapter 1 Financial Sector and Low Carbon Economy: An Analysis***

Merton and Bodie, (1995, p.12), Allen and Gale (2001), Dominic and Mark (2014), Quality Walden (2019), Gertner et al (1994), Grossman and Hart (1986), Naohiko Baba and Takamsa Hisada (2002), OECD (2009), OECD, IEA (2010), Ricardo De Bonis and Alberto Franco Pozzolo (2012), Stefania and Roberto (2016), Williamson (1975), World Bank, (2004), UNFCCC (2008), and Yongfu Huang and Terry Barker (2011).

## ***Chapter 2. An Empirical Study on Carbon Pricing for Green Economy***

Alper (2018), Bayer and Aklin (2020), Ceres, 2014; CPLC (2017), Chirag Gajjar (2018), Commission Regulation (EC) No 2216/2004, Daniel et al (2020), Elgie and McClay (2013), Emanuele Campiglio (2015), Governor of New Mexico (2019), ICC (2015), IEA(2012); Ioanna and Paraskevi (2018), McCollum et al.(2014), Nordhaus, (2002; Nordhaus. B (2015), Parry et al (2014), Pearce (1991), Miller et al (2013), Rathnaswamy (1995), Rio Declaration (1992), World Bank (2015), The Guardian (2012), The Kyoto Protocol (1997), WEF (2013), World Bank (2017), and World Bank (2019, 2020),

### ***3. New global financial system- green growth: a review***

Alier (2009), Antonio Guterres (2020), Batrancea Ioan et al (2020), BCSD, 2017, BSDC,2017; Buitter, 2012; Climate (2020), CIELP,2011, Demirguc-Kunt and Maksimovic (1998, 1999), de la Torre, Ize, and Schmukler (2012), Forster et al (2020), Gough (2017), Iacono et al (2020), Jackson (2009), Hickel and Kallis, (2019), Maran (2017, 2017a, 2018, 2020a), Maran et al. (2020, 2020b), Eurostat (2020), Simon Kuper (2019), Victor (2008), Kallis et al (2012), Kallis,2018, Giddings, 2002, Umbrella Paper (2013), WEF (2015),and World Bank (2019),

## ***Chapter 1: Financial Sector and Low Carbon Economy: An Analysis***

***Summary:*** *In this chapter, the Low Carbon Economy is considered an important form of economic growth in which there is sustainable economic growth with low global warming through reduction in N<sub>2</sub>O emissions from the energy sector, and agriculture, CO<sub>2</sub> emissions from manufacturing and from others, and greenhouse gas (GHG). The low carbon economy aims to lessening N<sub>2</sub>O, CO<sub>2</sub>, and GHG towards sustainable development. There is additional investment which may be sourced by Pension, Insurance, private Bonds, Public Bonds, and Stock Market Capitalization from the financial sector of economy. This is examined through empirical analysis.*

This chapter examines the financial sector which includes Pension, Insurance, Private Bonds, Public Bonds and Stock Market Capitalization and low carbon economy for which N<sub>2</sub>O from the energy sector, N<sub>2</sub>O from agriculture, CO<sub>2</sub> from manufacturing, CO<sub>2</sub> from others and greenhouse gas(GHG) are included in this think about.

The relationship between monetary division speculation and low carbon economy in five countries of Japan, China, Brazil, Germany, and India for the period 2000-2017, is explored.

In each budgetary framework, there's budgetary profundity which is picked up through private credit which incorporates managing an account and capital showcase, resources of budgetary education, private financing which joins managing an account, non-banking financing, capital advertise, residential stock capitalization, and private securities and stock exchanging esteem. The financial framework is not widespread as each country has different priorities and impediments indeed in spite of the fact that there is an inclination for steady and energetic budgetary framework to develop with changes. .

Low Carbon Development has no accepted definition, but it is commonly accepted that it refers to Low Emission Development Strategies (LEDs). The low carbon economy is discussed to narrate the challenges.

European Union identifies the finance and investment challenges. There are a few recommendations in this respect. One of them is to attain the move to a worldwide moo carbon economy and society and it leads to long-term maintainable development whereas coordination moderation and adjustment. It intends to mobilise additional finance and investment for achieving 2 degree Celsius and for the same, there is a need for improvement in technology innovation and capacity building.

The green financial system promotes green growth and carbon reduction while eliminating poverty. The efforts are pursued to achieve social and economic equity without environmental degradation.

## ***Chapter 2: An Empirical Study on Carbon Pricing for Green Economy***

*Summary: In this chapter, the Carbon pricing initiatives among other policies are considered to implement the Paris Agreement for the reduction of global warming in pursuant to achieve low carbon economy towards sustainable development. In this regard, many models are examined using empirical analysis.*

This **Chapter 2** examines Carbon pricing to achieve carbon reduction and regulating global warming. Carbon pricing increases green investment and it collects compensation for the environmental damages. In carbon pricing, there are two aspects which include carbon price which is compensated for the carbon emission and there is a price before carbon emission which can be traded under the Emission Trading System. The principles and practices of carbon tax and Emission Trading System are discussed and investigated in the econometric analysis.

### *Chapter 3: New global financial system- green growth: a review*

*Summary: In this chapter, the need for new financial system is discussed to achieve low carbon economy towards sustainable development using econometric analysis as the existing financial system demands new thinking, institutions, approaches and resolution for practices.*

In **Chapter 3**, the new global financial system is discussed to promote a green economy. The global financial system must promote sustained economic growth and social development for which three core pillars of the future of the global financial system and these pillars need to contribute to economic growth and financial stability. An effective financial system establishes an effective network of financial institutions, financial markets, financial instruments and financial services for promoting financial integration within the economy for effective production, distribution and development. The financial system offers opportunities to transfer risks on investment and in this process, the borrowers generate funds in the financial system. The Covid Pandemics have drastically reduced the investment mechanism due to lockdown and preventive measures of Covid Protocols and social distancing.

There is a need for long term green investment to achieve sustainable economic growth for carbon reduction and eradication of poverty.

The direct interventions of government and international institutions on sustainable long-term finance have not yielded results and there must be a focus on reforms that prevent market failures and institutional weaknesses. New reforms are proposed and discussed and for the same factors which are the Profundity of Money related Teach, Depth of Financial Institutions, Access to Financial Institutions, and Efficiency of Financial Institutions. In this regard, the adjusted net savings after the calculation of damages on account of the exploitation of natural resources and carbon emissions are included in this study.
